2.2.3 Luminous flux

It is the light energy radiated out per second from the body in the form of luminous light waves. The unit of luminous flux is lumen (lm).

In LED lamps,

15 Watts= 900 Lumens

2.2.4 Lumen

It is the unit of luminous flux. One lumen is defined as the luminous flux emitted per unit solid angle from a point source of one candle power.

2.2.5 Luminous intensity (I)

Luminous intensity or Candle-power of a point source in any particular direction is given by the luminous flux radiated out per unit solid angle in the direction.

2.2.6 Lux

The amount of light that causes a luminous flux over a square meter surface is called lux.

2.2.7 Mean Horizontal Candle Power (MHCP)

It is the mean of the candle powers in all directions in the horizontal plane containing the source of light.

2.2.8 Glare

Glare is difficulty seeing in the presence of bright light such as direct or reflected sun light or artificial light. It causes annoyance, discomfort or interference with vision or eye fatigue.

2.2.9 Space height ratio

Space height ratio is defined as the ratio of the distance between adjacent luminaries (center to center) to their height above the working plane.

2.2.10 Utilization factor

Utilization factor or coefficient of utilization is defined as the ratio of total lumens reaching the working plane to the total lumens given out by the lamp.

$$\text{Utilization factor} = \frac{\text{Lumens reaching at the working place}}{\text{Total lumens emitted by the source}}$$

It usually varies from 0.5 to 0.8.

Do you Know?

An American inventor, Thomas Alva Edison, discovered 1368 inventions. His most popular invention is electric bulb. He invented many devices in the field such as mass communication, electric power generation, sound recording and motion pictures. Edison designed a system of conductors, meters, lamp fixtures, sockets, fuses and current switches.
