is fixed on the top of the stove, in which utensils were kept. Three pin plugs are used as supply terminal in this stove. Rubber bush is kept at the bottom of the stove for grip. In this, various facilities like child lock safety, timer, temperature indicator and cooking options were included.

3.3.2 Working principle

An alternating supply is made to flow through the resonant coil, which leads to the generation of oscillating magnetic field. The magnetic field induces an electric current inside the cookware. The induction cook top works with cookware made of certain materials which have specific properties. The Induction stove transfers electrical energy by induction from a coil of wire into a metal vessel that must be ferromagnetic. The coil is mounted under the cooking surface, and a high frequency of alternating current is passed through it. The current in the coil creates a dynamic magnetic field. The magnetic field induces whirling electrical eddy currents inside the pan, turning into a heater. Heat from the pan flows directly into the food or water kept inside the container, by conduction method of heat.

High production of heat is the specialty of this stove. No heat losses will occur. This type of stove can be used in all climatic condition.

3.3.3 Uses

i. Function is faster than other types of stoves.
ii. Easy to clean.
iii. Stains produced in this can be easily cleaned with cloth.
iv. Cost is less.
v. No noise occurs while functioning.
vi. Burns or wounds will not be caused when touched.

3.3.4 Difference between regular stove tops and induction cook tops

Regular stove tops heat pots and pans through contact, flames or electrical heating elements. Regular stovetops generate heat, and the heat is transferred through the contact from the burner to the base of the pot. This process is known as thermal conduction.

On the other hand, the Induction cook tops do not generate heat. Induction burners have a coiled wire just below the ceramic surface, which generates an oscillating magnetic field. The key to induction cooks tops is that the pots and pans used must be made of magnetic material to work with this system.

The induction cook top will induce the electrons in a magnetic material to move around, creating an electric current. This current generates heat in the pot. If you place your hand, or a glass pot on an induction cook top, neither will heat up because they are not magnetic and therefore not affected by the alternating magnetic field of the induction burner.

3.4 Bread toaster

A Bread toaster, or a toast maker, is an electric small appliance designed to toast sliced breads by exposing it to radiant heat, thus converting it into toast. It is a portable device.
