- Prime mover

Impeller

It is the rotating part of the pump. The impeller is mounted on a shaft and is connected with an electric motor. It is rotated by the motor and consists of series of backward curved blades.

Casing

It is an air tight passage which surrounds the impeller. The design of the casing is done in such a way that it is capable of converting the kinetic energy of the water discharging from the outlet of the impeller into pressure energy before it leaves the casing and enters into the delivery pipe.

History of Centrifugal pumps

- The inventor not be named with assurance.
- In the 17th century, Jordan an Italian had made some drawing of a centrifugal pump.
- In the early 18 century, French physicist Papin built a centrifugal pump of primitive design.
- In 1732 Demouir pumps was put on service in France.
- In 1818 Andrews (USA) built a single stage centrifugal pump.
- Then many developments came in the industry.

Suction Pipe with Foot Valve

A pipe whose one end is connected with the inlet of the pump and the other end is dipped into the sump of water is called suction pipe.

The suction pipe consists of a foot valve and strainer at its lower end. The foot valve is a one way valve (Non-return
