The GPS provides full coverage with minimum of 4 satellites at any place all over the globe. These 4 GPS satellite broadcast signals simultaneously from the space that are picked up and identified by GPS receivers. Each GPS receiver then provides three dimensional location (latitude, longitude and altitude) plus time.

Uses of GPS

a. **Location** – Determining a basic position
b. **Navigation** – Getting from one location to another
c. **Tracking** – Monitoring the movement of people and things
d. **Mapping** – Creating maps
e. **Timing** – Provides precise timing

Application of GPS

1. Land applications
2. Air applications
3. Marine applications
4. Space applications
5. Military applications

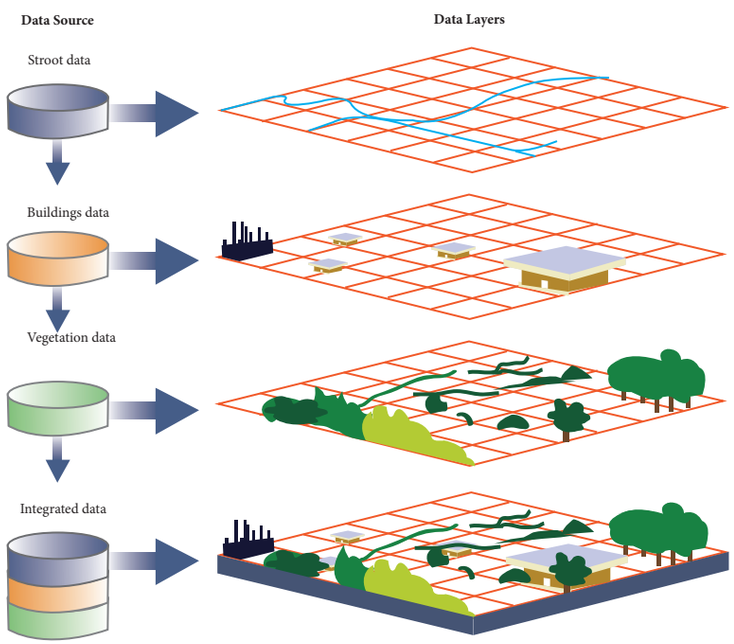

3.4.4 Geographic Information system (GIS)

GIS is a system designed to capture, store, manipulate, analyze, manage and present geographic data.

GIS applications are tools that allow users to analyze geographical information, edit data in maps, and present the results of all these operation.

GIS updates geographical data without wasting time to visit the field and update a database manually.

Geographical Information System
