

Sedimentation with coagulation

Types of Sedimentation

There are two types of sedimentation. They are

1. Plain sedimentation
2. Sedimentation with coagulation

Plain sedimentation

1. Plain sedimentation

In this, the raw water is retained for sometime in a huge tank for the suspended particles to settle down by the action of gravity.

2. Sedimentation with coagulation

In this, certain chemical compound called coagulant is added to water to assist sedimentation. The coagulant react with impurities in water and convert them into settleable solids.

4.4.4 Filtration

Filtration is the process of passing the water through the filter beds. Filtration removes colour, odour, turbidity and pathogenic bacterias from water.

Theory of filtration

The filtration involves the following actions

1. Mechanical straining
2. Sedimentation and absorption
3. Biological metabolism
4. Electrolytic changes

1. Mechanical straining

The filtering media contains a number of voids between the sand grains. When water is passed through these voids, the suspended particles which are bigger in size than the voids are retained on the surface of the sand bed. This action is called mechanical straining which removes the suspended particles.
