When the above code is executed, it produces the following result:

Output:

Example-3 Keyword arguments
Name : Gshan
Age : 25

Note

In the above program the parameters orders are changed

7.5.3 Default Arguments

In Python the default argument is an argument that takes a default value if no value is provided in the function call. The following example uses default arguments, that prints default salary when no argument is passed.

Example:

```
def printinfo( name, salary = 3500):
        print ("Name: ", name)
        print ("Salary: ", salary)
        return
printinfo("Mani")
```

When the above code is executed, it produces the following output

Output:

Name: Mani
Salary: 3500

When the above code is changed as print info("Ram",2000) it produces the following output:

Output:

Name: Ram
Salary: 2000

In the above code, the value 2000 is passed to the argument salary, the default value already assigned for salary is simply ignored.
