In Variable Length arguments we can pass the arguments using two methods.

1. Non keyword variable arguments
2. Keyword variable arguments

Non-keyword variable arguments are called **tuples**. You will learn more about tuples in the later chapters. The Program given is an illustration for non keyword variable argument.

Note

Keyword variable arguments are beyond the scope of this book.

The Python's print() function is itself an example of such a function which supports variable length arguments.

7.6 Anonymous Functions

What is anonymous function?

In Python, anonymous function is a function that is defined without a name. While normal functions are defined using the **def** keyword, in Python anonymous functions are defined using the **lambda** keyword. Hence, anonymous functions are also called as **lambda** functions.

What is the use of lambda or anonymous function?

- Lambda function is mostly used for creating small and one-time anonymous function.
- Lambda functions are mainly used in combination with the functions like filter(), map() and reduce().

Note

filter(), map() and reduce() functions are beyond the scope of this book.

Lambda function can take any number of arguments and must return one value in the form of an expression. Lambda function can only access global variables and variables in its parameter list.
