8.6 String Formatting Operators

The string formatting operator is one of the most exciting feature of python. The formatting operator % is used to construct strings, replacing parts of the strings with the data stored in variables.

Syntax:

("String to be display with %val1 and %val2" %(val1, val2))

Example

```
name = "Rajarajan"
mark = 98
print ("Name: %s and Marks: %d" %(name,mark))
```

Output

```
Name: Rajarajan and Marks: 98
```
