Example (Accessing single element):

```
>>> Marks = [10, 23, 41, 75]
>>> print (Marks[0])
10
```

In the above example, print command prints 10 as output, as the index of 10 is zero.

Example: Accessing elements in revevrse order

```
>>> Marks = [10, 23, 41, 75]
>>> print (Marks[-1])
  75
```

Note

A negative index can be used to access an element in reverse order.

(i) Accessing all elements of a list

Loops are used to access all elements from a list. The initial value of the loop must be zero. Zero is the beginning index value of a list.

Example

```
Marks = [10, 23, 41, 75]
i = 0
while i < 4:
        print (Marks[i])
        i = i + 1
```

Output

```
10
23
41
75
```

In the above example, Marks list contains four integer elements i.e., 10, 23, 41, 75. Each element has an index value from 0. The index value of the elements are 0, 1, 2, 3 respectively. Here, the while loop is used to read all the elements. The initial value of the loop is zero, and the test condition is i < 4, as long as the test condition is true, the loop executes and prints the corresponding output.
