Example

```
>>> del MySubjects
>>> print(MySubjects)
Traceback (most recent call last):
File "<pyshell#9>", line 1, in <module>
print(MySubjects)
NameError: name 'MySubjects' is not defined
```

Here, >>> del MySubjects, deletes the list MySubjects entirely. When you try to print the elements, Python shows an error as the list is not defined. Which means, the list MySubjects has been completely deleted.

As already stated, the remove( ) function can also be used to delete one or more elements if the index value is not known. Apart from remove( ) function, pop( ) function can also be used to delete an element using the given index value. pop( ) function deletes and returns the last element of a list if the index is not given.

The function clear( ) is used to delete all the elements in list, it deletes only the elements and retains the list. Remember that, the del statement deletes entire list.

Syntax:

```
List.remove(element)          # to delete a particular element
List.pop(index of an element)
List.clear( )
```

Example

```
>>> MyList=[12,89,34,'Kannan', 'Gowrisankar', 'Lenin']
>>> print(MyList)
        [12, 89, 34, 'Kannan', 'Gowrisankar', 'Lenin']
>>> MyList.remove(89)
>>> print(MyList)
        [12, 34, 'Kannan', 'Gowrisankar', 'Lenin']
```

In the above example, MyList has been created with three integer and three string elements, the following print statement shows all the elements available in the list. In the statement >>> **MyList.remove(89)**, deletes the element 89 from the list and the print statement shows the remaining elements.
