Note

Type ( ) function is used to know the data type of a python object.

(ii) Creating Single element tuple

While creating a tuple with a single element, add a comma at the end of the element. In the absence of a comma, Python will consider the element as an ordinary data type; not a tuple. Creating a Tuple with one element is called "Singleton" tuple.

Example

```
>>> MyTup4 = (10)
>>> type(MyTup4)
        <class 'int'>
>>> MyTup5 = (10,)
>>> type(MyTup5)
        <class 'tuple'>
```

9.2.3 Accessing values in a Tuple

Like list, each element of tuple has an index number starting from zero. The elements of a tuple can be easily accessed by using index number.

Example

```
>>> Tup1 = (12, 78, 91, "Tamil", "Telugu", 3.14, 69.48)
# to access all the elements of a tuple
>>> print(Tup1)
        (12, 78, 91, 'Tamil', 'Telugu', 3.14, 69.48)
#accessing selected elements using indices
>>> print(Tup1[2:5])
        (91, 'Tamil', 'Telugu')
#accessing from the first element up to the specified index value
>>> print(Tup1[:5])
        (12, 78, 91, 'Tamil', 'Telugu')
# accessing from the specified element up to the last element.
>>> print(Tup1[4:])
        ('Telugu', 3.14, 69.48)
# accessing from the first element to the last element
>>> print(Tup1[:])
        (12, 78, 91, 'Tamil', 'Telugu', 3.14, 69.48)
```
