9.2.4 Update and Delete Tuple

As you know a tuple is immutable, the elements in a tuple cannot be changed. Instead of altering values in a tuple, joining two tuples or deleting the entire tuple is possible.

Example

```
# Program to join two tuples
Tup1 = (2,4,6,8,10)
Tup2 = (1,3,5,7,9)
Tup3 = Tup1 + Tup2
print(Tup3)
```

Output

```
(2, 4, 6, 8, 10, 1, 3, 5, 7, 9)
```

To delete an entire tuple, the del command can be used.

Syntax:

del tuple_name

Example

```
Tup1 = (2,4,6,8,10)
print("The elements of Tup1 is ", Tup1)
del Tup1
print (Tup1)
```

Output:

```
The elements of Tup1 is  (2, 4, 6, 8, 10)
Traceback (most recent call last):
File "D:/Python/Tuple Examp 1.py", line 4, in <module>
print (Tup1)
NameError: name 'Tup1' is not defined
```

Note that, the print statement in the above code prints the elements. Then, the del statement deletes the entire tuple. When you try to print the deleted tuple, Python shows the error.

9.2.5 Tuple Assignment

Tuple assignment is a powerful feature in Python. It allows a tuple variable on the left of the assignment operator to be assigned to the values on the right side of the assignment
