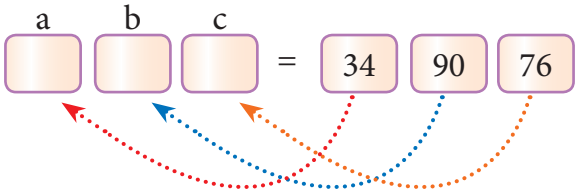
operator. Each value is assigned to its respective variable.



Example

```
>>> (a, b, c) = (34, 90, 76)
>>> print(a,b,c)
        34 90 76
# expression are evaluated before assignment
>>> (x, y, z, p) = (2**2, 5/3+4, 15%2, 34>65)
>>> print(x,y,z,p)
        4 5.666666666666667 1 False
```

Note that, when you assign values to a tuple, ensure that the number of values on both sides of the assignment operator are same; otherwise, an error is generated by Python.

9.2.6 Returning multiple values in Tuples

A function can return only one value at a time, but Python returns more than one value from a function. Python groups multiple values and returns them together.

Example : Program to return the maximum as well as minimum values in a list

```
def Min_Max(n):
    a = max(n)
    b = min(n)
    return(a, b)
Num = (12, 65, 84, 1, 18, 85, 99)
(Max_Num, Min_Num) = Min_Max(Num)
print("Maximum value = ", Max_Num)
print("Minimum value = ", Min_Num)
```

Output:

```
Maximum value =  99
Minimum value =  1
```
