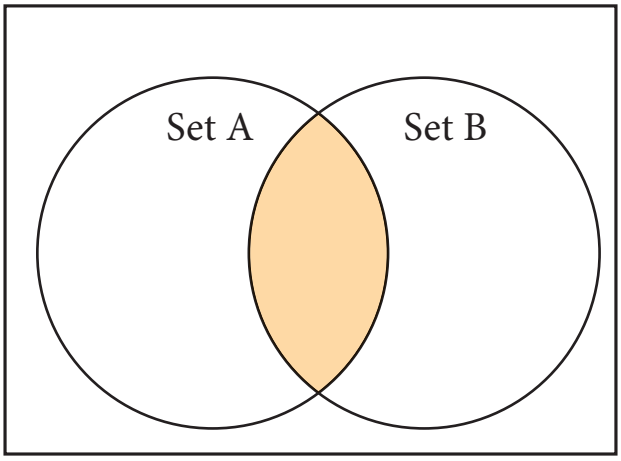
(ii) Intersection: It includes the common elements in two sets



The operator & is used to intersect two sets in python. The function **intersection( )** is also used to intersect two sets in python.

Example: Program to insect two sets using intersection operator

```
set_A={'A', 2, 4, 'D'}
set_B={'A', 'B', 'C', 'D'}
print(set_A & set_B)
```

Output:

```
{'A', 'D'}
```

Example: Program to insect two sets using intersection function

```
set_A={'A', 2, 4, 'D'}
set_B={'A', 'B', 'C', 'D'}
print(set_A.intersection(set_B))
```

Output:

```
{'A', 'D'}
```
