Unit V

# CHAPTER 14

# IMPORTING C++ PROGRAMS IN PYTHON

NE9SJV

## Learning Objectives

After the completion of this chapter, the student will be able to

- Understand what is wrapping
- Able to import C++ functions and classes in to Python programs
- Create environment to work with both languages
- Execute and debug Python programs

## 14.1 Introduction

Python and C++ are general-purpose programming language. However, Python is quite different from C++.

| S.NO | PYTHON | C++ |
|---|---|---|
| 1 | Python is typically an "interpreted" language | C++ is typically a "compiled" language |
| 2 | Python is a dynamic-typed language | C++ is compiled statically typed language |
| 3 | Data type is not required while declaring variable | Data type is required while declaring variable |
| 4 | It can act both as scripting and general purpose language | It is a general purpose language |

Yet these two languages complement one another perfectly. Python is mostly used as a scripting or "glue", language. That is, the top level program mostly calls routines written in C or C++. This is useful when the logic can be written in terms of existing code (For example a program written in C++) but can be called and manipulated through Python program.
