main(sys.argv[1])	The input file (C++ file) is send along with its path as a list(array) using **argv[1]**. **argv[0]** contains the Python program which is need not to be passed because by default __main__ contains source code reference

14.6.2.2 Python's OS Module

The ***OS*** module in Python provides a way of using operating system dependent functionality.

The functions that the ***OS*** module allows you to interface with the Windows operating system where Python is running on.

os.system(): Execute the C++ compiling command (a string contains Unix, C command which also supports C++ command) in the shell (Here it is Command Window). For Example to compile C++ program **g++** ***compiler*** should be invoked. To do so the following command is used.

os.system ('g++ ' + <variable_name1> ' -<mode> ' + <variable_name2>

where each argument contains

os.system :-	function system() defined in **os** module to interact with the operating system
g++ :-	General compiler to compile C++ program under Windows Operating system.
variable_name1:-	Name of the C++ file along with its path and without extension .cpp in string format
mode :-	To specify input or output mode. Here it is o prefixed with hyphen.
variable_name2 :-	Name of the executable file without extension .exe in string format

For example the command to compile and execute C++ program is given below

os.system('g++ ' + cpp_file + ' -o ' + exe_file)	g++ compiler compiles the file cpp_file and –o (output) send to exe_file

Note

'+' in os.system() indicates that all strings are concatenated as a single string Therfore give a space after each word for the above argument. For example **'g++ ' + cpp_file + ' -o ' + exe_file**
