Local(**L**)	Defined inside function/class
Enclosed(**E**)	Defined inside enclosing functions (Nested function concept)
Global(**G**)	Defined at the uppermost level
Built-in (**B**)	Reserved names in built-in functions (modules)

3.4 Types of Variable Scope

There are 4 types of Variable Scope, let's discuss them one by one:

3.4.1 Local Scope

Local scope refers to variables defined in current function. Always, a function will first look up for a variable name in its local scope. Only if it does not find it there, the outer scopes are checked.

Look at this example

1. **Disp():** 2. a:=7 3. print a 4. Disp()	Entire program Disp( ): a:=7 print a Disp ( )	Output of the Program 7

On execution of the above code the variable ***a*** displays the value 7, because it is defined and available in the local scope.
