Where, **prompt string** in the syntax is a statement or message to the user, to know what input can be given.

If a prompt string is used, it is displayed on the monitor; the user can provide expected data from the input device. The **input( )** takes whatever is typed from the keyboard and stores the entered data in the given variable. If prompt string is not given in **input( )** no message is displayed on the screen, thus, the user will not know what is to be typed as input.

Example 1:input( ) with prompt string

```
>>> city=input ("Enter Your City: ")
        Enter Your City: Madurai
>>> print ("I am from ", city)
        I am from Madurai
```

Example 2:input( ) without prompt string

```
>>> city=input()
        Rajarajan
>>> print ("I am from", city)
        I am from Rajarajan
```

Note that in example-2, the **input( )** is not having any prompt string, thus the user will not know what is to be typed as input. If the user inputs irrelevant data as given in the above example, then the output will be unexpected. So, to make your program more interactive, provide prompt string with **input( ).**

The **input ( )** accepts all data as string or characters but not as numbers. If a numerical value is entered, the input values should be explicitly converted into numeric data type. The **int( )** function is used to convert string data as integer data explicitly. We will learn about more such functions in later chapters.

Example 3:

```
x = int (input("Enter Number 1: "))
y = int (input("Enter Number 2: "))
print ("The sum = ", x+y)
```

Output:

```
        Enter Number 1: 34
        Enter Number 2: 56
        The sum = 90
```
