Example 4: Alternate method for the above program

```
x,y=int (input("Enter Number 1 :")),int(input("Enter Number 2:"))
print ("X = ",x," Y = ",y)
```

Output:

```
Enter Number 1 :30
Enter Number 2:50
X =  30  Y =  50
```

5.5 Comments in Python

In Python, comments begin with hash symbol **(#)**. The lines that begins with # are considered as comments and ignored by the Python interpreter. Comments may be single line or no multi-lines. The multiline comments should be enclosed within a set of ''' '''(triple quotes) as given below.

```
# It is Single line Comment
''' It is multiline comment
which contains more than one line '''
```

5.6 Indentation

Python uses whitespace such as **spaces** and **tabs** to define program blocks whereas other languages like C, C++, java use curly braces { } to indicate blocks of codes for class, functions or body of the loops and block of selection command. The number of whitespaces (spaces and tabs) in the indentation is not fixed, but all statements within the block must be indented with same amount spaces.

5.7 Tokens

Python breaks each logical line into a sequence of elementary lexical components known as **Tokens**. The normal token types are

1) Identifiers,
2) Keywords,
3) Operators,
4) Delimiters and
5) Literals.

Whitespace separation is necessary between tokens, identifiers or keywords.

5.7.1. Identifiers

An Identifier is a name used to identify a variable, function, class, module or object.
