Python supports the following Arithmetic operators.

Operator - Operation	Examples	Result
Assume a=100 and b=10. Evaluate the following expressions		
+ (Addition)	>>> a + b	110
- (Subtraction)	>>>a – b	90
* (Multiplication)	>>> a*b	1000
/ (Divisioin)	>>> a / b	10.0
% (Modulus)	>>> a % 30	10
** (Exponent)	>>> a ** 2	10000
// (Floor Division)	>>> a//30 (Integer Division)	3

Program 5.1 To test Arithmetic Operators:

```
#Demo Program to test Arithmetic Operators
        a=100
        b=10
        print ("The Sum        = ",a+b)
        print ("The Difference = ",a-b)
        print ("The Product    = ",a*b)
        print ("The Quotient   = ",a/b)
        print ("The Remainder  = ",a%30)
        print ("The Exponent   = ",a**2)
        print ("The Floor Division =",a//30)
#Program End
```

Output:

```
        The Sum             = 110
        The Difference      = 90
        The Product         = 1000
        The Quotient        = 10.0
        The Remainder       = 10
        The Exponent        = 10000
        The Floor Division  = 3
```

(ii) Relational or Comparative operators

A Relational operator is also called as **Comparative** operator which checks the relationship between two operands. If the relation is true, it returns **True**; otherwise it returns **False**.
