Program 5.6 : To demonstrate Numeric literals

```
# Program to demonstrate Numeric Literals
        a = 0b1010                  #Binary Literals
        b = 100                     #Decimal Literal
        c = 0o310                   #Octal Literal
        d = 0x12c                   #Hexadecimal Literal
        print ("Integer Literals :",a,b,c,d)
        #Float Literal
        float_1 = 10.5
        float_2 = 1.5e2
        print ("Float Literals :",float_1,float_2)
        #Complex Literal
        x = 1 + 3.14 j
        print ("Complex Literals :", x)
        Print ("x = ", x , "Imaginary part of x = ", x.imag, "Real part of x = ", x.real)
#End of the Program
```

Output:

```
Integer Literals : 10 100 200 300
Float Literals : 10.5 150.0
Complex Literals :
x = (1.3.14) Imaginary part of x = 3.14 Real part of x = 1.0
```

(ii) String Literals

In Python a string literal is a sequence of characters surrounded by quotes. Python supports single, double and triple quotes for a string. A character literal is a single character surrounded by single or double quotes. The value with triple-quote ''' ''' is used to give multi-line string literal.

Program 5.7 To test String Literals

```
# Demo Program to test String Literals
        strings = "This is Python"
        char = "C"
        multiline_str = '''This is a multiline string with more than one line code.'''
        print (strings)
        print (char)
        print (multiline_str)
# End of the Program
```

Output:

```
This is Python
C
This is a multiline string with more than one line code.
```
