

7.5.1 Required Arguments

"Required Arguments" are the arguments passed to a function in correct positional order. Here, the number of arguments in the function call should match exactly with the function definition. You need atleast one parameter to prevent syntax errors to get the required output.

Example :

```
def printstring(str):
        print ("Example - Required  arguments ")
        print (str)
        return
# Now you can call printstring() function
printstring()
```

When the above code is executed, it produces the following error.

```
Traceback (most recent call last):
File "Req-arg.py", line 10, in <module>
printstring()
    TypeError: printstring() missing 1 required positional argument: 'str'
```

Instead of **printstring()** in the above code if we use **printstring ("Welcome")** then the output is

Output:

Example - Required arguments
Welcome
