order in terms of the integers 1,2,3, ..., n. Ranks may be assigned according to the level of performance in a test, a contest, a competition, an interview, or a show. The candidates appearing in an interview, for example, may be assigned ranks in integers ranging from I to n, depending on their performance in the interview.

Sources of Collection of data

Based on the data sources, data could be seen as of two types, viz., secondary data and primary data. The two can be defined as under:

(i) Primary data: Those data which do not already exist in any form, and thus have to be collected for the first time from the primary source(s). By their very nature, these data are fresh and first-time collected covering the whole population or a sample drawn from it

(ii) Secondary data: They already exist in some form: published or unpublished in an identifiable secondary source. They are, generally, available from published source(s), though not necessarily in the form actually required. Eg. Data from CSO, NSSO, RBI….

Classifications Of Data

12.10 Arithmetic mean or mean ($\bar{X}$)

Central value is called a measure of central tendency or an average or a measure of locations. There are five averages. Among them mean, median and mode are called simple averages and the other two averages geometric mean and harmonic mean are called special averages.

Meaning of Average

- "A measure of central tendency is a typical value around which other figures congregate."
- "An average stands for the whole group of which it forms a part yet represents the whole."
- "One of the most widely used set of summary figures is known as measures of location."
