

The shipping option is simplistic. It displays each order that hasn't yet been shipped, one order per page. The seller can choose to skip to the next or can ship the order, using the information from the page as appropriate.

The shipping function is clearly not going to survive long in the real world, but shipping is also one of those areas where reality is often stranger than you might think. Overspecify it up front, and we're likely to get it wrong. For now, let's leave it as it is, confident that we can change it as the user gains experience using our application.

Data

Finally, we need to think about the data we're going to be working with.

Notice that we're not using words such as *schema* or *classes* here. We're also not talking about databases, tables, keys, and the like. We're talking about data. At this stage in the development, we don't know if we'll even be using a database.
