```
Product.delete_all
# . . .
product = Product.create(title: 'Rails Scales!',
  description:
    %(<p>
      <em>Practical Techniques for Performance and Growth</em>
      Rails doesn’t scale. So say the naysayers. They’re wrong. Ruby on
Rails
      runs some of the biggest sites in the world, impacting the lives of
      millions of users while efficiently crunching petabytes of data. This
      book reveals how they do it, and how you can apply the same techniques
      to your applications. Optimize everything necessary to make an
      application function at scale: monitoring, product design, Ruby code,
      software architecture, database access, caching, and more. Even if
your
      app may never have millions of users, you reduce the costs of hosting
      and maintaining it.
    </p>),
  price: 30.95)

  product.image.attach(io: File.open(
    Rails.root.join('db', 'images', 'cprpo.jpg')),
      filename: 'cprpo.jpg')

  product.save!
# . . .
```

This code starts by deleting all the existing products from the database. It then creates a new set of products, attaches an image to each one, and saves the record. The `save!` method is used to save the record to the database. If there’s an error, it’ll raise an exception.

Note that this code uses `%(...)`. This is an alternative syntax for double-quoted string literals, convenient for use with long strings.

To populate your `products` table with test data, run the following command:

```
depot> bin/rails db:seed
```
