Now let’s get the product listing tidied up. Normally this would require multiple steps: creating a CSS style sheet, linking that style sheet to your HTML, defining a set of style rules within the new style sheet, connecting these rules to the page by defining an HTML `class` attribute on the page, and changing the HTML to make styling the page easier.

Fortunately, we installed Tailwind CSS support, which is ideal for rapid development. Instead of spending time managing global CSS classes and trying to understand and debug the scope of your changes, you safely style your HTML page through an extensive set of predefined CSS utility classes.

With Tailwind doing the heavy lifting for us, we’ll use a table-based template, editing the `index.html.erb` file in `app/views/products` and replacing the scaffold-generated view:

rails80/depot_a/app/views/products/index.html.erb

```
<div class="w-full">
  <% if notice.present? %>
    <p class="py-2 px-3 bg-green-50 mb-5 text-green-500 font-medium
              rounded-lg inline-block" id="notice">
      <%= notice %>
    </p>
  <% end %>

  <div class="flex justify-between items-center pb-8">
    <h1 class="mx-auto font-bold text-4xl">Products</h1>
  </div>

  <table id="products" class="mx-auto">
    <tfoot>
      <tr>
        <td colspan="3">
          <div class="mt-8">
            <%= link_to 'New product',
                        new_product_path,
                        class: "inline rounded-lg py-3 px-5 bg-green-600
                                text-white block font-medium" %>
          </div>
```
