- We added `mx-auto` to the `h1` and `table` to center them horizontally on the page. This corresponds to setting the CSS margin to auto, where `x` is the horizontal axis and `y` would be the vertical axis.

- We added classes like `px-2` and `py-3` to add vertical and horizontal padding.

- Most of the rest of the changes are self-explanatory, with names like `text-xl`, `bg-green-600`, and `hover:underline`.

We loaded some test data into the database, and we rewrote the `index.html.erb` file that displays the listing of products. Before we proceed, there is a small bit of administrivia we need to attend to. Much like how we installed active storage tables earlier, we need to connect Active Storage to our views. We do this by adding the following line to the `app/controller/application_controller.rb` file:

rails80/depot_a/app/controllers/application_controller.rb

```
class ApplicationController < ActionController::Base
  # Only allow modern browsers supporting webp images, web push, badges,
  # import maps, CSS nesting, and CSS :has.
  allow_browser versions: :modern

  include ActiveStorage::SetCurrent
end
```

Like before, this only needs to be done once, and only if we're storing files on disk. If you're using a cloud storage provider, you can skip this step.

Unrelated to this change, this file also contains a line that blocks browsers that don't support modern standards.[43] Feel free to remove or modify this line at this time.

Now let's bring up a browser and point to http://localhost:3000/products. The resulting product listing might look something like the screenshot
