- Methods with names that end with `_later` are Active Job methods. Active Job is a framework for declaring jobs and making them run on a variety of queuing backends. We cover Active Job in more detail starting with *Iteration H1: Sending Confirmation Emails*.

- Methods with names that start with `turbo_` are part of the Turbo framework. Turbo is a set of tools that make it easy to build modern, reactive web applications. We cover Turbo in more detail starting with *Iteration F2: Creating a Hotwired Cart*.

Now, when you make changes to the product listing, they should appear automatically on the page. With that, we've completed the styling of the product listing. Now it's time to create the storefront.

What We Just Did

In this chapter, we laid the groundwork for our store application:

- We created a development database.

- We installed Active Storage to handle file uploads.

- We used a migration to create and modify the schema in our development database.

- We created the `products` table and used the scaffold generator to write an application to maintain it.

- We updated a controller-specific view to show a list of products.

- We made the product listing update in real time.

What we've done didn't require much effort, and it got us up and running quickly. Databases are vital to this application but need not be scary. In fact, in many cases we can defer the selection of the database and get started using the default that Rails provides.
