```
depot> bin/rails db:rollback
```

Your schema will be transported back in time, and the `products` table will be gone. Calling `bin/rails db:migrate` again will re-create it. You'll also want to reload the seed data. More information can be found in Chapter 23, *Migrations*.

- We made the product listing update in real time as the database changes. Hotwire Spark[44] updates views in real time as the application changes. Try running this:

```
depot> bundle add hotwire-spark --group development
```

Then restart your server and make a change to a controller or view. You should see the change reflected in your browser without needing to refresh the page.

- We mentioned version control in *Version Control*, and now would be a great point at which to save your work. Should you happen to choose Git (highly recommended, by the way), you need to do a tiny bit of configuration first; all you need to do is provide your name and email address:

```
depot> git config --global --add user.name "Sam Ruby"
depot> git config --global --add user.email rubys@intertwingly.net
```

You can verify the configuration with the following command:

```
depot> git config --global --list
```

Rails also provides a file named `.gitignore`, which tells Git which files are not to be version-controlled:

rails80/depot_a/.gitignore

```
# Ignore bundler config.
/.bundle

# Ignore all environment files.
```
