We have two more items to validate. First, we want to make sure that each product has a unique title. One more line in the `Product` model will do this. The uniqueness validation will perform a check to ensure that no other row in the `products` table has the same title as the row we're about to save:

```
validates :title, uniqueness: true
```

Lastly, we need to validate that the image uploaded is of a supported type. We'll do this by calling `validate` with the value `:acceptable_image` and by defining a corresponding `acceptable_image` method, which matches `image.content_type` against a list of supported types:

```
validate :acceptable_image

def acceptable_image
  return unless image.attached?

  acceptable_types = [ "image/gif", "image/jpeg", "image/png" ]
  unless acceptable_types.include?(image.content_type)
    errors.add(:image, "must be a GIF, JPG or PNG image")
  end
end
```

Note that we previously specified the set of acceptable content types in the product form, but it's possible for that to be bypassed. This validation ensures that only the specified types are accepted.

So in a couple of minutes we've added validations that check the following:

- The title, description, and image URL fields aren't empty.
- The price is a valid number not less than $0.01.
- The title is unique among all products.
- The image is of the right content type.

Your updated `Product` model should look like this:

rails80/depot_b/app/models/product.rb
