```
  class Product < ApplicationRecord
    has_one_attached :image
»   after_commit -> { broadcast_refresh_later_to "products" }
    validates :title, :description, :image, presence: true
    validates :title, uniqueness: true
    validate :acceptable_image

    def acceptable_image
      return unless image.attached?

      acceptable_types = [ "image/gif", "image/jpeg", "image/png" ]
      unless acceptable_types.include?(image.content_type)
        errors.add(:image, "must be a GIF, JPG or PNG image")
      end
    end
    validates :price, numericality: { greater_than_or_equal_to: 0.01 }
  end
```

Nearing the end of this cycle, we ask our customer to play with the application, and she's a lot happier. It took only a few minutes, but the simple act of adding validation has made the product maintenance pages seem a lot more solid.
