```
    product = Product.new
    assert product.invalid?
    assert product.errors[:title].any?
    assert product.errors[:description].any?
    assert product.errors[:price].any?
    assert product.errors[:image].any?
  end
```

We can rerun just the unit tests by issuing the `rails test:models` command. When we do so, we now see the test execute successfully:

```
depot> bin/rails test:models
Rebuilding...

Done in 225ms.
Running 1 tests in a single process (parallelization threshold is 50)
Run options: --seed 44564

# Running:

.

Finished in 0.055882s, 17.8948 runs/s, 89.4742 assertions/s.
1 runs, 5 assertions, 0 failures, 0 errors, 0 skips
```

Sure enough, the validation kicked in, and all our assertions passed.

Clearly, at this point we can dig deeper and exercise individual validations. Let's look at three of the many possible tests.

First, we'll check that the validation of the price works the way we expect:

rails80/depot_c/test/models/product_test.rb

```
  test "product price must be positive" do
    product = Product.new(title:       "My Book Title",
                          description: "yyy")
    product.image.attach(io: File.open("test/fixtures/files/lorem.jpg"),
                         filename: "lorem.jpg", content_type: "image/jpeg")
    product.price = -1
    assert product.invalid?
```
