```
    assert_equal [ "must be greater than or equal to 0.01" ],
      product.errors[:price]

    product.price = 0
    assert product.invalid?
    assert_equal [ "must be greater than or equal to 0.01" ],
      product.errors[:price]

    product.price = 1
    assert product.valid?
  end
```

In this code, we create a new product and then try setting its price to `-1`, `0`, and `+1`, validating the product each time. If our model is working, the first two should be invalid, and we verify that the error message associated with the `price` attribute is what we expect.

The last price is acceptable, so we assert that the model is now valid. (Some folks would put these three tests into three separate test methods—that's perfectly reasonable.)

Next, we test that we're validating that the image URL ends with one of `gif`, `jpg`, or `png`:

rails80/depot_c/test/models/product_test.rb

```
  def new_product(filename, content_type)
    Product.new(
      title:       "My Book Title",
      description: "yyy",
      price:       1
    ).tap do |product|
      product.image.attach(
        io: File.open("db/images/#{filename}"), filename:, content_type:)
    end
  end

  test "image url" do
    product = new_product("lorem.jpg", "image/jpeg")
    assert product.valid?, "image/jpeg must be valid"
```
