The test assumes that the database already includes a row for the Ruby book. It gets the title of that existing row using this:

```
products(:pragprog).title
```

It then creates a new `Product` model, setting its title to that existing title. It asserts that attempting to save this model fails and that the `title` attribute has the correct error associated with it.

If you want to avoid using a hardcoded string for the Active Record error, you can compare the response against its built-in error message table:

rails80/depot_c/test/models/product_test.rb

```
test "product is not valid without a unique title - i18n" do
  product = Product.new(title:       products(:pragprog).title,
                        description: "yyy",
                        price:       1)

  product.image.attach(io: File.open("test/fixtures/files/lorem.jpg"),
                       filename: "lorem.jpg", content_type: "image/jpeg")

  assert product.invalid?
  assert_equal [ I18n.translate("errors.messages.taken") ],
               product.errors[:title]
end
```

We'll cover the I18n functions in Chapter 15, *Task J: Internationalization*.

Before we move on, we once again try our tests:

```
$ bin/rails test
```

This time we see two remaining failures, both in `test/controllers/products_controllertest.rb`: one in `should create product` and the other in `should update product`. Clearly, something we did caused something to do with the creation and update of products to fail. Since we just added
