```
»           title: @title
          }
        }
      end

      assert_redirected_to product_url(Product.last)
    end
```

rails80/depot_b/test/controllers/products_controller_test.rb

```
    test "should update product" do
        patch product_url(@product), params: {
          product: {
            description: @product.description,
»           image: file_fixture_upload("lorem.jpg", "image/jpeg"),
            price: @product.price,
»           title: @title
          }
        }

      assert_redirected_to product_url(@product)
    end
```

After making these changes, we rerun the tests, and they report that all is well.

Now we can feel confident that our validation code not only works but will continue to work. Our product now has a model, a set of views, a controller, and a set of unit tests. It'll serve as a good foundation on which to build the rest of the application.

One Final Change

We originally stored product images in the `db/images` directory, but now we have our test fixtures, let's create a new place to store them: `text/fixtures/files`. Move the images over, and update the paths in the `new_product` method in `test/models/products.rb`.

What We Just Did
