In a few dozen lines of code, we augmented the generated code with validation:

- We ensured that required fields are present.
- We ensured that price fields are numeric and at least one cent.
- We ensured that titles are unique.
- We ensured that images have a supported content type.
- We updated the unit tests that Rails provided, both to conform to the constraints we've imposed on the model and to verify the new code we added.

We show this to our customer, and although she agrees that this is something an administrator could use, she says that it certainly isn't anything that she would feel comfortable turning loose on her customers. Clearly, in the next iteration we're going to have to focus a bit on the user interface.

Playtime

Here's some stuff to try on your own:

- If you're using Git, now is a good time to commit your work. You can first see which files we changed by using the `git status` command:

```
depot> git status
# On branch master
# Changes not staged for commit:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes
#    in working directory)
#
# modified:   app/models/product.rb
# modified:   test/fixtures/products.yml
# modified:   test/controllers/products_controller_test.rb
# modified:   test/models/product_test.rb
# no changes added to commit (use "git add" and/or "git commit -a")
```

  Since we modified only some existing files and didn't add any new ones, you can combine the `git add` and `git commit` commands and simply
