issue a single `git commit` command with the `-a` option:

```
depot> git commit -a -m 'Validation!'
```

With this done, you can play with abandon, secure in the knowledge that you can return to this state at any time by using a single `git checkout .` command.

- The `:length` validation option checks the length of a model attribute. Add validation to the `Product` model to check that the title is at least ten characters.

- Change the error message associated with one of your validations.
