Inside the body, we set the page heading to the value in the `@page_title` instance variable. By default, this is blank, meaning there won't be an `H1` rendered, but any controller that sets the variable `@page_title` can override this. The real magic, however, takes place when we invoke `yield`. This causes Rails to substitute in the page-specific content—the stuff generated by the view invoked by this request. Here, this'll be the catalog page generated by `index.html.erb`.

The page design is fairly minimal, though we've added a lot of padding, margins, and other speccing directives to ensure a decent layout for the side nav and main content. Some of the sizes we've used might seem strange (for example, `mt-4` and `px-5`), but everything should work out. Anytime we need padding, margin, or any other size, we'll use one of a few hand-picked sizes that ensure our layout is always decent.

Refresh the page, and the browser window looks something like the screenshot shown. It won't win any design awards, but it'll show our customer roughly what the final page will look like.

Looking at this page, we spot a minor problem with how prices are displayed. The database stores the price as a number, but we'd like to show it as dollars and cents. A price of 12.34 should be shown as $12.34, and 13 should display as $13.00. We'll tackle that next.
