rails80/depot_i/test/controllers/line_items_controller_test.rb

```
      test "should create line_item" do
        assert_difference("LineItem.count") do
          post line_items_url, params: { product_id: products(:pragprog).id }
        end

        follow_redirect!

»      assert_select "h2", "Your Cart"
»      assert_select "td", "The Pragmatic Programmer"
      end
```

What We Just Did

Our shopping cart is now something the client is happy with. Along the way, we covered the following:

- Adding a column to an existing table, with a default value
- Migrating existing data into the new table format
- Providing a flash notice of an error that was detected
- Using the logger to log events
- Removing a parameter from the permitted list
- Deleting a record
- Adjusting the way a table is rendered, using Tailwind CSS classes

But, just as we think we've wrapped up this functionality, our customer wanders over with a copy of *Information Technology and Golf Weekly*. Apparently, it has an article about the Hotwire style of browser interface, where stuff gets updated on the fly. Hmmm…let's look at that tomorrow.

Playtime

Here's some stuff to try on your own:

- Create a migration that copies the product price into the line item, and change the `add_product` method in the `Cart` model to capture the price
