```
<%= turbo_stream.replace 'cart' do %>
  <%= render partial: 'layouts/cart', locals: {cart: @cart} %>
<% end %>
```

Whether you create the turbo stream response inline in your controller or make use of an HTML template is a matter of personal taste, but generally a template is recommended, particularly when multiple items are in the response.

All that's remaining is to update the controller. Since we followed the default naming conventions for the template, we don't need to pass any arguments to the `format.turbo_stream` call.

rails80/depot_m/app/controllers/line_items_controller.rb

```
    def create
      product = Product.find(params[:product_id])
      @line_item = @cart.add_product(product)

      respond_to do |format|
        if @line_item.save
»         format.turbo_stream
          format.html { redirect_to store_index_url }
          format.json { render :show,
            status: :created, location: @line_item }
        else
          format.html { render :new,
            status: :unprocessable_entity }
          format.json { render json: @line_item.errors,
            status: :unprocessable_entity }
        end
      end
    end
```

The Customer Is Never Satisfied

We're feeling pretty pleased with ourselves. We changed a handful of lines of code, and our boring old Web 1.0 application now sports Hotwire speed stripes. We breathlessly call the client over to come look. Without saying
