```
  }
}

.line-item-highlight {
  animation: line-item-highlight 1s;
}
```

The `@keyframes` directive defines an animation, in this case named `line-item-highlight`. Inside that declaration, we specify what the state of the DOM element should be at various points in the animation. At the start of the animation (`0%`), the element should have a background color of bright green, which is the highlight color. At the end of the animation (`100%`), it should have no background color.

Next we define a CSS class named `line-item-highlight` that uses the `animation` attribute. It accepts the name of the animation (which we just defined) and an animation time, which we've set at one second (note that you don't have to name the CSS class the same as the animation, but it can help keep it all straight if you do).

The last step is to use this class on the recently added item. To do that, our ERB template needs to know which item is the most recently added item. Set that inside `LineItemsController`:

rails80/depot_o/app/controllers/line_items_controller.rb

```
    def create
      product = Product.find(params[:product_id])
      @line_item = @cart.add_product(product)

      respond_to do |format|
        if @line_item.save
»         format.turbo_stream { @current_item = @line_item }
          format.html { redirect_to store_index_url }
          format.json { render :show,
            status: :created, location: @line_item }
        else
          format.html { render :new,
```
