```
        <% end %>
      <% end %>
    <% end %>
  </ul>
  </div>
```

All that remains to be done is to broadcast the HTML for a product every time an update is made:

rails80/depot_o/app/controllers/products_controller.rb

```
    def update
      respond_to do |format|
        if @product.update(product_params)
          format.html { redirect_to @product,
            notice: "Product was successfully updated." }
          format.json { render :show, status: :ok, location: @product }
»
»       @product.broadcast_replace_later_to "store/products",
»         partial: "store/product"
        else
          format.html { render :edit,
            status: :unprocessable_entity }
          format.json { render json: @product.errors,
            status: :unprocessable_entity }
        end
      end
    end
```

We're calling `broadcast_replace_later_to` because we want the messages to go out asynchronously, and generally after this request completes. We specify the channel and the partial to be used.

To start the Action Cable process (and to pick up the configuration change if that was done), we need to restart the server. The first time you visit the Depot page you'll see additional messages on the server window (information slightly abbreviated to fit within the book margins):

```
Started GET "/cable" for 127.0.0.1
Started GET "/cable/" [WebSocket] for 127.0.0.1
Successfully upgraded to WebSocket
```
