- The `@apply` directive[64] is a Tailwind CSS feature that enables you to combine a set of utility classes into a single CSS class.
- The `field_with_errors`[65] class is a Rails feature that is added to form fields that have errors. This class is used to style the form fields differently when there are errors.
- With CSS, the most specific rule wins. In this case, the `.field_with_errors .input-field` rule is more specific than the `.input-field` rule, so classes included in it will take precedence. There is no need to repeat the classes in the less specific `.input-field` rule as they will be applied to elements that include this class.

With this change in place, we can simplify the form template:

```
<div class="my-5">
  <%= form.label :name %>
  <%= form.text_field :name, class: "input-field" %>
</div>
```

There are many reasons to consider factoring out repeated definitions into a style sheet: perhaps it's to reduce repetition to ease maintenance, perhaps it's to reduce visual clutter so that you can focus on the structure of the document, or perhaps it's merely to keep the number of columns down so that it will fit on the printed page. Any of these are good reasons, and they all apply here.

Once we've replaced the class attributes for the `form.text_field` and wrapped other lines to fit on the page, we make a second set of changes:

rails80/depot_o/app/views/orders/_form.html.erb

```
<%= form_with(model: order, class: "contents") do |form| %>
  <% if order.errors.any? %>
    <div id="error_explanation" class="bg-red-50 text-red-500 px-3 py-2
      font-medium rounded-md mt-3">
      <h2><%= pluralize(order.errors.count, "error") %>
```
