In the `create` action, we assumed that the order object contains the `add_line_items_from_cart` method, so let's implement that method now:

rails80/depot_p/app/models/order.rb

```
    class Order < ApplicationRecord
      # ...
»     def add_line_items_from_cart(cart)
»       cart.line_items.each do |item|
»         item.cart_id = nil
»         line_items << item
»       end
»     end
    end
```

For each item that we transfer from the cart to the order, we need to do two things. First we set the `cart_id` to `nil` to prevent the item from going poof when we destroy the cart.

Then we add the item itself to the `line_items` collection for the order. Notice we didn't have to do anything special with the various foreign-key fields, such as setting the `order_id` column in the line item rows to reference the newly created order row. Rails does that knitting for us using the `has_many` and `belongs_to` declarations we added to the `Order` and `LineItem` models. Appending each new line item to the `line_items` collection hands the responsibility for key management over to Rails. We also need to modify the test to reflect the new redirect:

rails80/depot_p/test/controllers/orders_controller_test.rb

```
      test "should create order" do
        assert_difference("Order.count") do
          post orders_url, params: { order: { address: @order.address,
            email: @order.email, name: @order.name,
            pay_type: @order.pay_type } }
        end

»       assert_redirected_to store_index_url
```
