If you run this test via `bin/rails test test/system/orders_test.rb`, it should pass. You've now tested a complex workflow using the browser, background jobs, and email.

What We Just Did

Without much code and with just a few templates, we've managed to pull off the following:

- We configured our development, test, and production environments for our Rails application to enable the sending of outbound emails.
- We created and tailored a mailer that can send confirmation emails in both plain-text and HTML formats to people who order our products.
- We used Active Job to execute slow-running code in the background so the user doesn't have to wait.
- We enhanced a system test to cover the entire end-to-end workflow, including verifying that the background job executed and the email was sent.

Playtime

Here's some stuff to try on your own:

- Add a `ship_date` column to the orders table, and send a notification when this value is updated by the `OrdersController`.
- Update the application to send an email to the system administrator—namely, yourself—when an application failure occurs, such as the one we handled in *Iteration E2: Handling Errors*.
- Modify `Pago` to sometimes return a failure (`OpenStruct.new(succeeded?: false)`), and handle that by sending a different email with the details of the failure.
