For a development machine, that’s about all you’ll need (apart from an editor, and we’ll talk about editors separately).

So, how do you get all this installed? It depends on your choice of development environment. We’ll go over three common choices: Windows, macOS, and Ubuntu Linux.

But before you dive in, recognize that, for best results, these instructions are meant for a fairly fresh, up-to-date, and clean machine. If this doesn’t match your situation, consider doing your development in a Docker container.[15] If you choose to go this way, you can skip the rest of this chapter and go to Chapter 2, *Instant Gratification*.
