For Rails to pick up this configuration change, the server needs to be restarted.

Since each page that's translated will have an `en` and an `es` version (for now —more will be added later), it makes sense to include this in the URL. Let's plan to put the locale up front, make it optional, and have it default to the current locale, which in turn will default to English.

To implement this cunning plan, let's start by modifying `config/routes.rb`:

rails80/depot_t/config/routes.rb

```
    Rails.application.routes.draw do
      get "admin" => "admin#index"
      get "up" => "rails/health#show", as: :rails_health_check

      resources :users
      resources :products
      resource :session
      resources :passwords, param: :token

»     scope "(:locale)" do
        resources :orders
        resources :line_items
        resources :carts
»       root "store#index", as: "store_index", via: :all
»     end
    end
```

We've nested our resources and root declarations inside a scope declaration for `:locale`. Furthermore, `:locale` is in parentheses, which is the way to say that it's optional. Note that we didn't choose to put the administrative and session functions inside this scope, because it's not our intent to translate them at this time.

What this means is that http://localhost:3000/ will use the default locale (namely, English) and therefore be routed exactly the same as http://localhost:3000/en. http://localhost:3000/es will route to the same
