```

You should see the data you entered into the conductor saved in the `SupportRequest` instance. You can also try this using the email of an order you have in your system to verify it locates the most recent order. Of course, manually checking our code isn't ideal. We would like to have an automated test. Fortunately, Rails provides a simple way to test our mailboxes, which you'll learn about now.

Testing Our Mailbox

When we used the generator to create our mailbox, you probably noticed the file `test/mailboxes/support_mailbox_test.rb` gets created. This is where we'll write our test. Since we generally know how to write tests, all we need to know now is how to trigger an email. Action Mailbox provides the method, `receive_inbound_email_from_mail`, which we can use in our tests to do just that.

We need two tests to cover the functionality of our mailbox. The first is to send an email from a customer without an order and verify we created a `SupportRequest` instance. The second is to send an email from a customer who *does* have orders and verify that the `SupportRequest` instance is correctly connected to their most recent order.

The first test is most straightforward since we don't need any test setup, so we'll create a new `test` block inside `test/mailboxes/support_mailbox_test.rb`:

rails80/depot_tb/test/mailboxes/support_mailbox_test.rb

```
  require "test_helper"

  class SupportMailboxTest < ActionMailbox::TestCase
»   test "we create a SupportRequest when we get a support email" do
```
