

You'll also see the mail printed out in your log, and you should see that the plain-text part of the email is free of formatting.

What We Just Did

- We configured and set up Action Mailbox to allow our app to receive support emails. We saw how to configure Rails to inspect each incoming email and route it to the right bit of code, called a mailbox.

- We also configured Active Storage, which Rails uses to store the raw emails it processes. With this setup, we could easily access cloud storage for any other purpose we might need.

- We used Action Text to enable rich-text editing for responding to support requests. With just a few lines of code, we have a cross-browser rich-text editing experience that works.

- We stripped out the rich text to send a plain-text email of our rich-text response.

Playtime

Here are some things you can try on your own:
