```
$ curl https://mise.run | sh
$ echo 'eval "$(~/.local/bin/mise activate bash)"' >> ~/.bashrc
$ eval "$(~/.local/bin/mise activate bash)"
```

If you're using another shell, consult the mise website for instructions. Next, we'll install Ruby 3.4.3, the latest version of Ruby 3.4 at the time of this writing:

```
$ mise use -g ruby@3.4.3
```

With this done, you can try running `ruby -v` on the command line. You should see 3.4.3 in the output.

Next, we'll install Rails itself. Rails is a RubyGem, and Ruby comes with the command `gem` that installs RubyGems. We'll use that to install Rails:

```
$ gem install rails -v 8.0.2 --no-document
```

When that completes, you can verify it worked by running `rails --version`. You should see 8.0.2 in the output.

This completes the setup of Ruby and Rails. The rest of this chapter will outline other software you might need to do development.
